

# The world's most unlikely expedition vehicle.

## Powered by sunshine.

The humble tuk tuk, also known as an auto-rickshaw, is used by millions of people around the world for their daily commute. They're loud, dirty, small and fun. What they're not known for is being part of a sustainable transport future, or the vehicle of choice for a long-distance expedition.

Until now.

Over the next twelve months a team of young Australians will convert a Thai-made tuk tuk into a three-wheeled, sun-powered, long-range electric vehicle to promote sustainable transport and a low-carbon future.

We will travel the length of Australia, and then around the globe, to show that an unlikely green vehicle can go the distance.

Our journey will involve outreach with schools, community groups, and sharing stories of innovation, environment, electric vehicles, and global adventure.

Is it possible? Can we make it? We don't know for sure - but it'll be a hell of a ride trying to find out.
